Company description

Mappa is a technological platform that allows companies in the automotive sector to measure, analyse, manage and reduce their environmental impact in an automatic, accurate and scalable way.

Products and services

They develop digital technology that enables manufacturers of automotive components and systems to calculate and reduce the carbon footprint associated with their products. Although they do not manufacture physical parts, their tool is integrated into the production and procurement processes of Tier 1, 2 and 3 companies, allowing the emissions of each module or component (such as wiring, coatings, electronics, etc.) to be traced throughout the entire supply chain.

Auxiliary services

Diverse

They provide digital services specialised in sustainability and decarbonisation for companies in the automotive sector. their platform allows to calculate, report and reduce the carbon footprint of products, processes and organisations in accordance with the main international standards (LCA, ISO 14064, ISO 14067, GHG Protocol, CSRD).

They offer solutions for:

- Automated calculation of emissions (scopes 1, 2 and 3).
- Traceability of materials and transport in the supply chain.
- Simulation of decarbonisation scenarios (buy plant, product for supplier).
- ESG reporting and regulatory compliance.
- Operational data integration via API and ERP/MES connectors.

Its services help Tier 1, 2 and 3 suppliers meet OEM requirements, provide transparency to their customers and reduce the climate impact of their operations.

Processes and technologies

Other technologies

They develop in-house their own cloud-based software for measuring, tracking and reducing CO2 emissions. Its technological capabilities are based on a modular architecture that integrates multiple data sources (energy, transport, raw materials, industrial processes, etc.) for real-time calculations and automated reporting.

Notable process innovations:

- Development of a proprietary climate calculation engine aligned with ISO 14064 and GHG Protocol.
- Open API system for connection to ERPs, IoT sensors and production management platforms.
- Scenario simulation platform to identify processes.
- Interactive visualisation tools to facilitate technical and strategic decision-making.

These technological capabilities allow them to adapt to industrial customer processes in complex, multi-stage environments, such as those in the automotive sector.

Main customers

Relats Grup, Embalex, Grupo Corona, Metra, MMM, UChange and Husk Ventures.
