## Company description

Synnect Technologies develops software for automation, prediction and optimisation of processes and system testing based on data, simulation and Digital Twin technologies. They offer a secure and reliable solution to centralise business data, facilitating strategic decision-making based on consolidated information.

### Products and services

Module or function

Sistemas de información

They work with Edge Computing software and V2X communications. The software solution can deploy anomaly detection or maintenance models and send and receive data securely over V2X systems. This software is being deployed on devices that can be installed in the vehicle, but can also work on-board.  
It allows the use of all types of data and communication protocols, as well as the connection to synthetic environments to connect real vehicles to a Digital Twin environment.

Auxiliary services

Diverse

Engineering

### Processes and technologies

Other technologies

Through their software they can create Digital Twins with predictive or simulation models in an agile way. These Digital Twins can be used for:  
– Improvement, optimisation and simulation of processes and operation scenarios.  
– Test benches for testing components (vehicle electronics, PLCs) on a Digital Twin.

## Contact

### Address and phone

Calle Area Portuaria de Bouzas S/N  
36208 Vigo, Pontevedra
